

Project Statement

The **Quiz Management System** is a Python-based desktop application designed to create, manage, and conduct multiple-choice quizzes efficiently. The system uses **Tkinter** to provide a user-friendly graphical interface and **SQLite3** for storing quiz questions and related data. It allows users to add, manage, and delete questions, attempt quizzes, evaluate answers automatically, and calculate scores instantly. The main purpose of the project is to reduce manual quiz management and answer-checking efforts while providing quick and accurate results. The system demonstrates the practical implementation of **database management, CRUD operations, automatic score calculation, and event-driven GUI programming using Python**. It can be further enhanced with features such as timers, question categories, difficulty levels, leaderboards, and result history.
